

Folder 03: Quality Assessment (QA)

1. Scoring Logic

Each of the **117 full-text articles** assessed for eligibility was evaluated using five Quality Assessment questions (QA1–QA5). A three-point scoring scale was applied to each question:

- **1.0:** The criterion was fully addressed.
- **0.5:** The criterion was partially addressed.
- **0.0:** The criterion was not addressed.

A minimum total score of **3.5 out of 5.0** was required for a study to be included in the final synthesis. This threshold helped ensure that the included studies provided sufficient dataset reporting, preprocessing detail, evaluation information, and reproducibility-related evidence.

2. QA_Scoring_Master_List.pdf

This is the main file for this folder. It contains the QA scores used to determine whether studies met the inclusion threshold. The final synthesis included 110 studies that passed the QA assessment. The 7 studies excluded after full-text eligibility and QA assessment are documented separately in the exclusion justification file.

3. 7 Excluded Papers with Justification

This audit document provides the technical justification for the 7 articles excluded during the full-text eligibility and QA assessment stage.
