

Folder 06: PRISMA Reporting Checklists

1. Overview

This folder contains the formal PRISMA reporting checklists for the Systematic Literature Review (SLR) titled “**Datasets and Data Preprocessing in Machine Learning-Based Insider Threat Detection: A Systematic Literature Review.**”

To support methodological transparency and reporting consistency, this review follows the **PRISMA 2020 statement**. These checklists serve as a guide for reviewers and editors by showing where each required reporting item is addressed in the manuscript, from the search strategy and study selection process to quality assessment, data extraction, and synthesis.

2. File Descriptions

File Name	Description	Format
06_01_PRISMA_2020_Main_Checklist.pdf	The Full 27-Item Checklist: This document explicitly maps each PRISMA requirement (e.g., Eligibility Criteria, Information Sources, Data Synthesis) to the specific page numbers and sections within the submitted manuscript.	PDF
06_02_PRISMA_2020_Abstract_Checklist.pdf	The Structured Abstract Checklist: A specialized 12-item checklist focused on the abstract. This ensures that the technical scope (RQ1–RQ4) and the final study count of 110 are clearly indexed.	PDF

3. Key Compliance Areas

In alignment with the PRISMA 2020 standards, specific attention has been given to the following technical sections of our SLR:

- **Search Strategy (Item 7):** Documentation of the Boolean search strings used to identify literature related to insider threat datasets, preprocessing, feature engineering, and machine learning across five academic databases.
- **Study Selection (Item 16):** Transparent reporting of the multi-stage screening process, from the initial database records to the final 110 included primary studies.
- **Quality Assessment (Item 11):** Although PRISMA commonly refers to risk-of-bias assessment, this data-centric ML review used a five-point *Quality Assessment* (QA) framework to assess dataset reporting, preprocessing detail, evaluation setup, and reproducibility-related information.
- **Synthesis Methods (Item 13):** Reporting of how evidence was extracted and synthesized across **RQ1–RQ4** using a hybrid AI-assisted and human-verified extraction workflow.
