

 Folder 06: PRISMA Reporting Checklists

1. Overview

This folder contains the formal reporting checklists for our Systematic Literature Review (SLR) titled: " **Datasets and Data Preprocessing Techniques for Machine Learning-Based Insider Threat Detection: A Systematic Literature Review .**"

To ensure the highest level of methodological transparency and compliance with international research standards, we have followed the **PRISMA 2020 (Preferred Reporting Items for Systematic Reviews and Meta-Analyses)** statement. These checklists serve as a navigational map for reviewers and editors, verifying that every essential reporting element—from the technical search strategy to the data synthesis protocols—is clearly addressed within the manuscript.

2. File Descriptions

File Name	Description	Format
06_01_PRISMA_2020_Main_Checklist.pdf	The Full 27-Item Checklist: This document explicitly maps each PRISMA requirement (e.g., Eligibility Criteria, Information Sources, Data Synthesis) to the specific page numbers and sections within the submitted manuscript.	PDF
06_02_PRISMA_2020_Abstract_Checklist.pdf	The Structured Abstract Checklist: A specialized 12-item checklist focused on the abstract. This ensures that the technical scope (RQ1–RQ4) and the final study count of 110 are clearly indexed.	PDF

3. Key Compliance Areas

In alignment with the PRISMA 2020 standards, specific attention has been given to the following technical sections of our SLR:

- **Search Strategy (Item 7):** Detailed documentation of the Boolean strings used to capture dataset, preprocessing, and feature engineering literature across five major academic databases.
- **Study Selection (Item 16):** Transparent reporting of the multi-stage funnel, illustrating the screening process from the initial records down to the final 110 primary studies.
- **Quality Assessment (Item 11):** While standard PRISMA refers to "Risk of Bias," we have utilized a robust 5-point Quality Assessment (QA) framework tailored specifically for data-centric machine learning research.
- **Synthesis Methods (Item 13):** Detailed reporting of how we synthesized **RQ1–RQ4** using a hybrid AI-human verification workflow to ensure accuracy in data extraction.
